

ROOT BARRIER

How to save roads and buildings from tree and plant root damage.

Nylex ROOT BARRIER.

Super light and super effective.

Migration of tree and plant roots can cause costly damage to foundations of roadways, pavements and buildings.

You can stop the roots with a wall of concrete, but that's unwieldy and expensive.

The best solution is Nylex Plastic Root Barrier.

It's light, easy to install with narrow-width excavator, yet provides an impenetrable and impervious barrier against roots – and burrowing animals.

The dimpled product profile gives extra frictional resistance against possible upward thrust generated by deflected roots.

Nylex Root Barrier is available in widths of 600, 900 and 1200mm.

Proven Strength.

Nylex Root Barrier was subjected to a penetration test, AS3706.4 –

'determination of indirect biaxial tensile strength' – CBR plunger method.

The tests showed a minimum force of 1100 Newtons was required before penetration occurred.
